Progress: new backend, client onboarding and admin console

What changed since the accuracy test, what works today, and what is left. Housedge, 26 October 2026.

In one paragraph. The app now runs on Supabase instead of Railway. Every page you know looks the same, but the data behind it lives in a database where each client can only ever see their own company. That rule is enforced by the database itself and checked by 66 automated tests. We added three things on top: invite-only accounts with proper passwords, a six-step onboarding for new clients, and an admin console. The console shows every client, what they cost us in AI, whether they are happy, and every answer the AI gave them with the evidence behind each finding. We loaded the 30 real Wolt answers from the accuracy test, so every screen in this report shows real data. **Not moved yet:** the part that actually asks the AI assistants (the "Run now" button and the weekly schedule). That is the next job.

66 / 66
database security checks pass

20 / 20
end-to-end account and data tests pass

4
new screens: join, onboarding, admin console, report rating

0
existing pages redesigned (as agreed)

What works today, and what does not yet

WORKS NOW ON SUPABASE

- Sign in, sign out, forgotten password (reset link made by admin)
- Invite-only accounts: admin creates a client and gets a one-time link
- Client onboarding: company, brand, competitors, questions, AI assistants, review
- All current client pages: Overview, Suggested actions, Questions, Competitors, Sources, Chats, Reports, Export
- Reports: created by the team, read and rated by the client
- Admin console: clients, spend vs budget, tokens, ratings, health, people, every answer with evidence
- Clients edit their own setup; fee and budget are team-only

NOT YET (SHOWS "BEING MOVED OVER" MESSAGE)

- **Run now** and the **weekly automatic check** (asking ChatGPT, Gemini, Perplexity, Claude)
- Website check (AI readiness), fact check, AI draft pages
- Testing an AI key from Settings
- Invite and reset emails sent automatically (today the admin copies the link and sends it)
- Hosting the front end on Vercel (it runs on a laptop for now)
- Moving the existing clients' history from Railway

Data and settings are safe; these buttons say so plainly instead of failing.

How it is built now

Browser
The same React app. Will be hosted on Vercel.

→

Supabase Edge Functions
Small server pieces that run on demand (Frankfurt). No server to keep awake, unlike Railway.

→

Postgres database
Stockholm (EU). Row-level security on every table: each row is tagged with its company.

→

AI assistants
OpenAI, Google, Perplexity, Anthropic. Next step.

- **Each request runs as the signed-in person.** The database decides what they may see, so a bug in our code cannot leak another client's data. A client asking for another company's project gets "not found".
- **Three kinds of people.** Admin (everything, including team and settings), team member (all clients), client (only their own company). Public sign-up is switched off.
- **Team-only fields are guarded in the database.** A client who edits their project cannot change their budget, fee or currency, even with a hand-made request. This is tested.
- **First admin.** Created once with a secret setup code; after that, setup closes for good.
- **Invite links** work once, expire in 7 days and are stored only as a fingerprint (hash), so even a database leak would not reveal them.

Tests run today

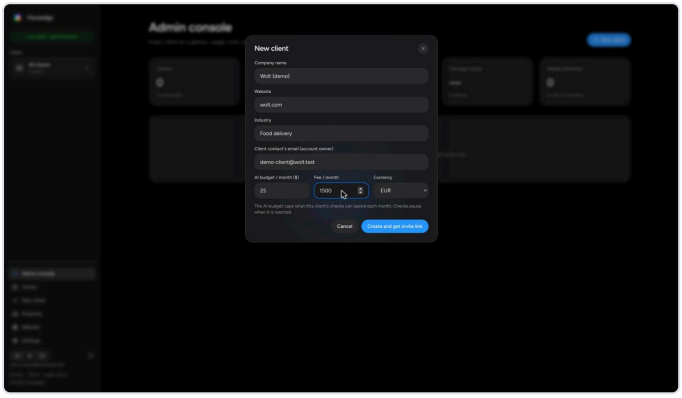

TEST	WHAT IT PROVES	RESULT
Database security (66 checks)	Signed-out visitors, strangers, two different clients, a team member and an admin each see and change exactly what they should. Clients cannot see health notes, the team list, settings, other clients' spend or ratings, and cannot raise their own budget.	**All pass**
Account flow (8 steps)	Setup stays closed once an admin exists; sign-up is off; admin creates a client; weak passwords are refused without using up the link; a link works once; client sees only its company; client cannot use admin actions; reset links work.	**All pass**
Data API (12 steps)	Every dashboard request the current pages make; client A cannot reach client B by any route; CSV export; reports; the public website form.	**All pass**
Supabase security advisor	Supabase's own scan of the project.	**1 warning**

The one warning is "leaked password protection" (checking new passwords against known breaches). It is only available on the paid Supabase plan; we already require 10+ characters with upper case, lower case and a number. The performance advisor only lists three indexes that are unused so far, which is normal for a new database. The tests create their own test accounts and delete them afterwards; they never touch real client data.

1. Bringing on a new client

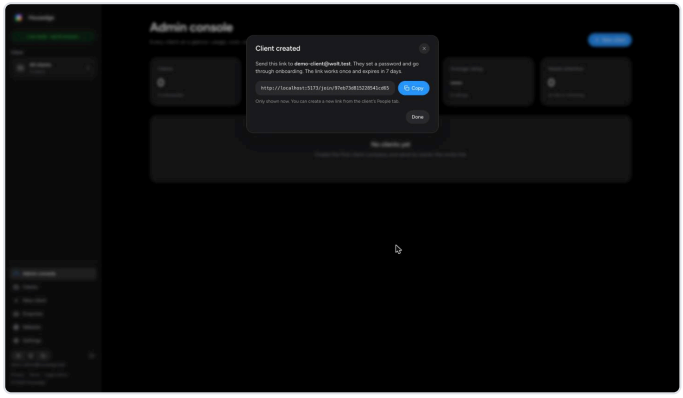

The team creates the client in the admin console. Housedge gives a one-time link to send them. The client sets a password and is taken straight into onboarding. They cannot reach the dashboard until onboarding is finished.

ADMIN: CREATE A CLIENT

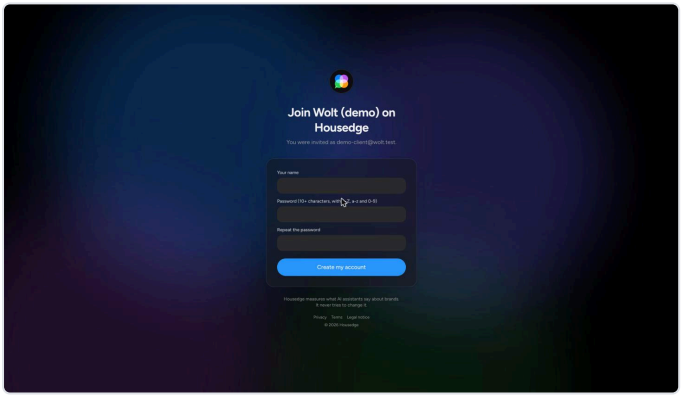

Company, website, owner's email, monthly AI budget and fee.

ADMIN: THE ONE-TIME INVITE LINK

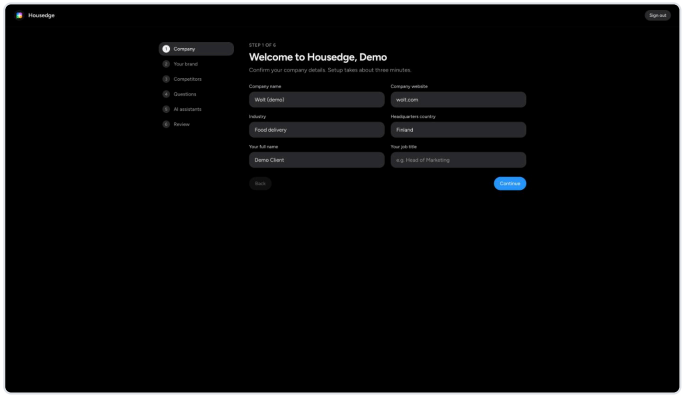

Shown once. A new one can be made from the People tab.

CLIENT: JOIN PAGE

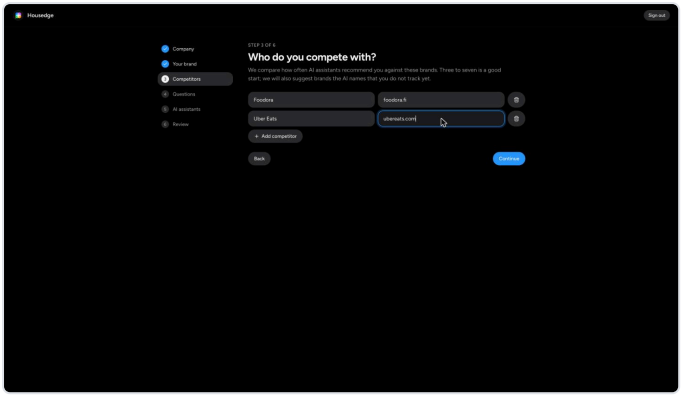

Name and password (10+ characters, mixed case, a number).

CLIENT: ONBOARDING, STEP 1

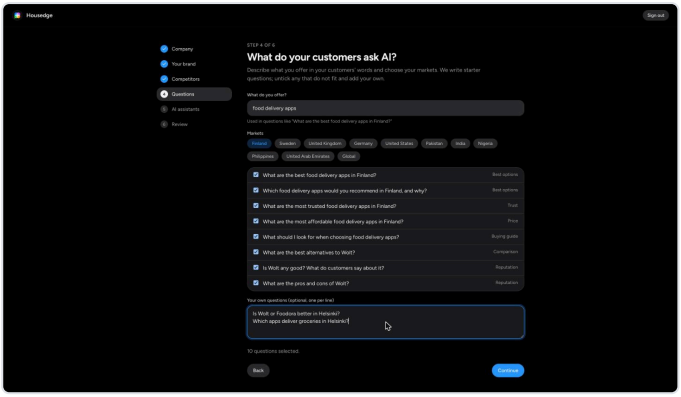

Company details, already filled in from what the team entered.

STEP 3: COMPETITORS

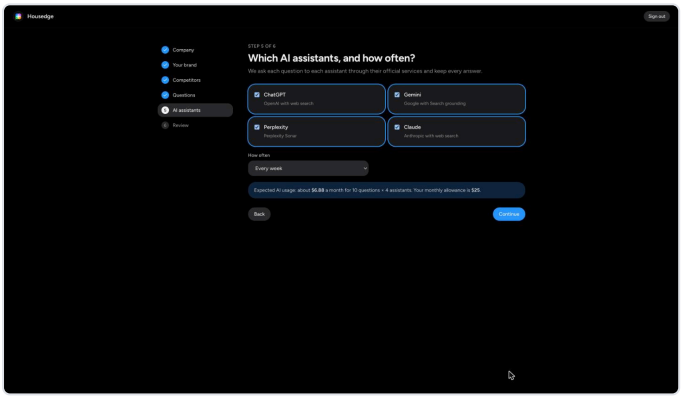

STEP 4: WHAT CUSTOMERS ASK AI

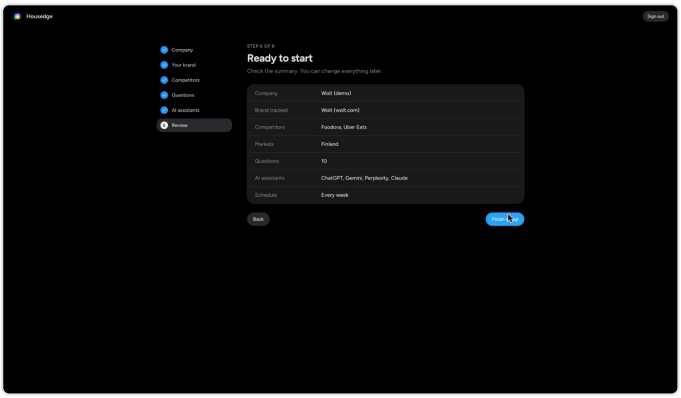

Starter questions are written from "what do you offer" and the chosen market; the client unticks any that do not fit and adds their own.

STEP 5: AI ASSISTANTS AND HOW OFTEN

Shows the expected monthly AI cost against the budget the team set.

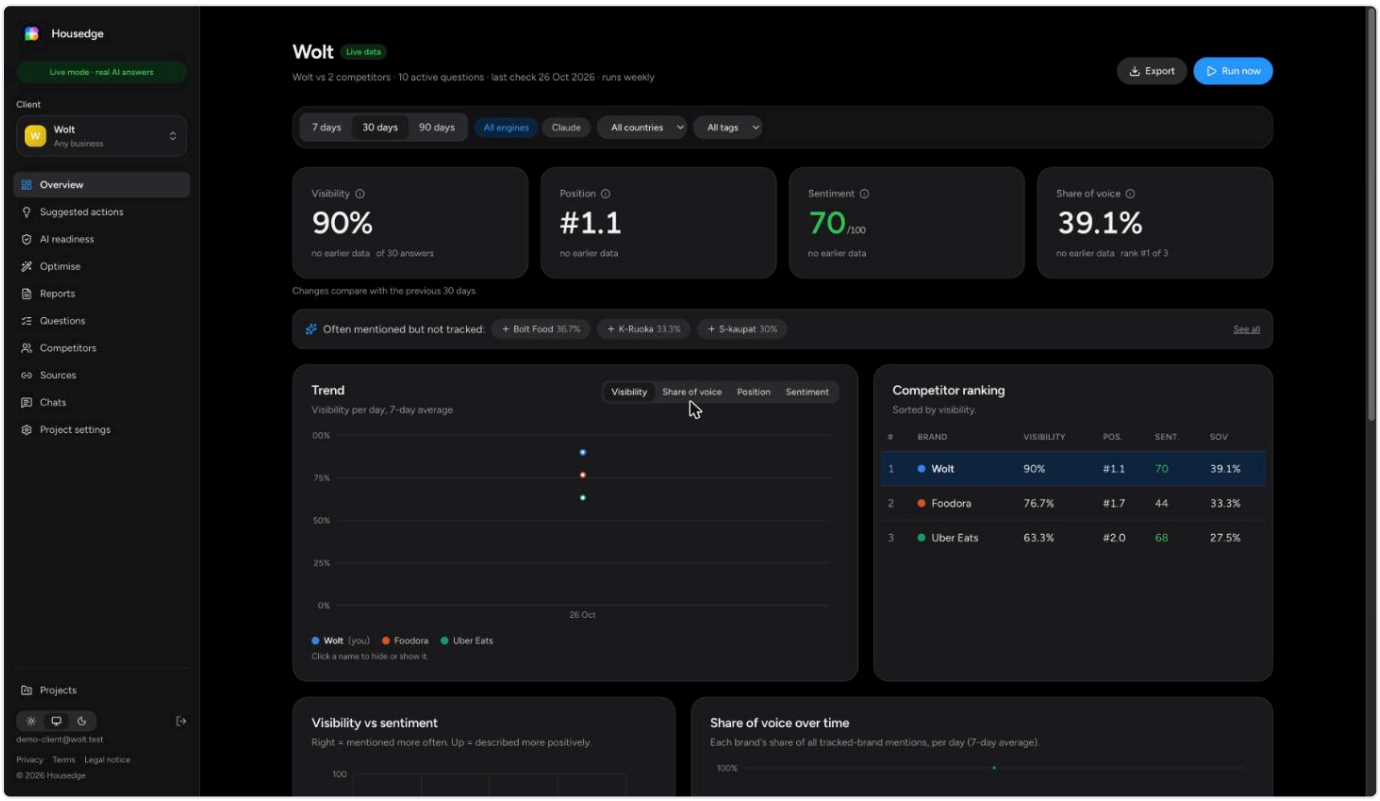

STEP 6: REVIEW

2. What the client sees

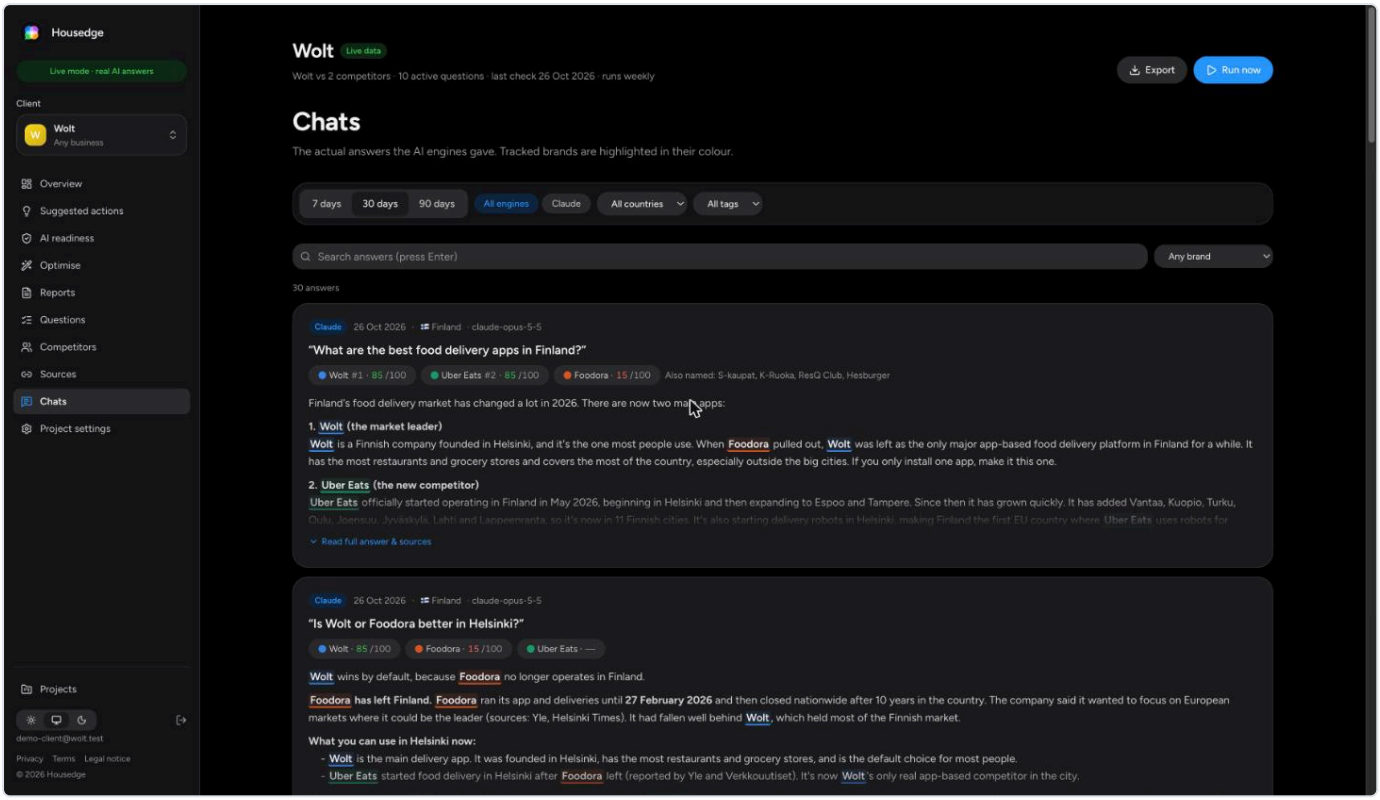

These are the existing pages, unchanged, now reading from Supabase. Clients land directly on their own Overview. Internal team pages (the sales board, Client journey, Discovery notes) are hidden from them. The data is the 30 real answers from the Wolt test (10 from Opus, 10 from Sonnet, 10 from Opus through the cheaper batch service).

OVERVIEW

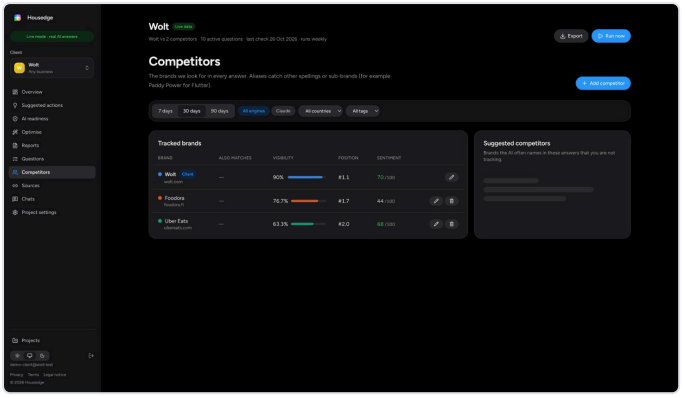

Wolt appears in 90% of answers, ranked #1 of 3. Brands the AI keeps naming that are not tracked yet (Bolt Food, K-Ruoka, S-kaupat) are suggested at the top.

CHATS: THE ACTUAL ANSWERS

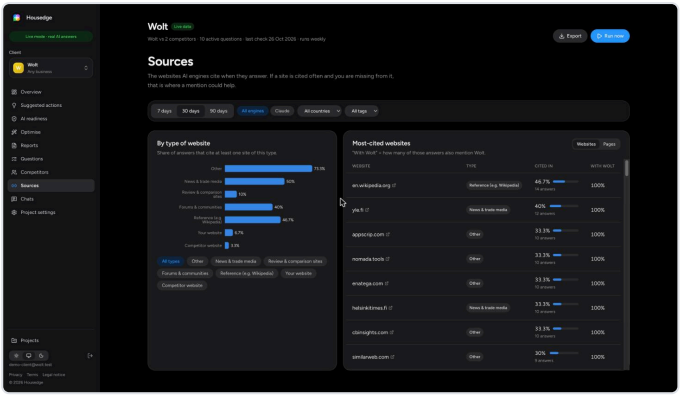

Every answer in full, with tracked brands highlighted. This is where a client sees that Claude knows Foodora left Finland in February 2026.

COMPETITORS

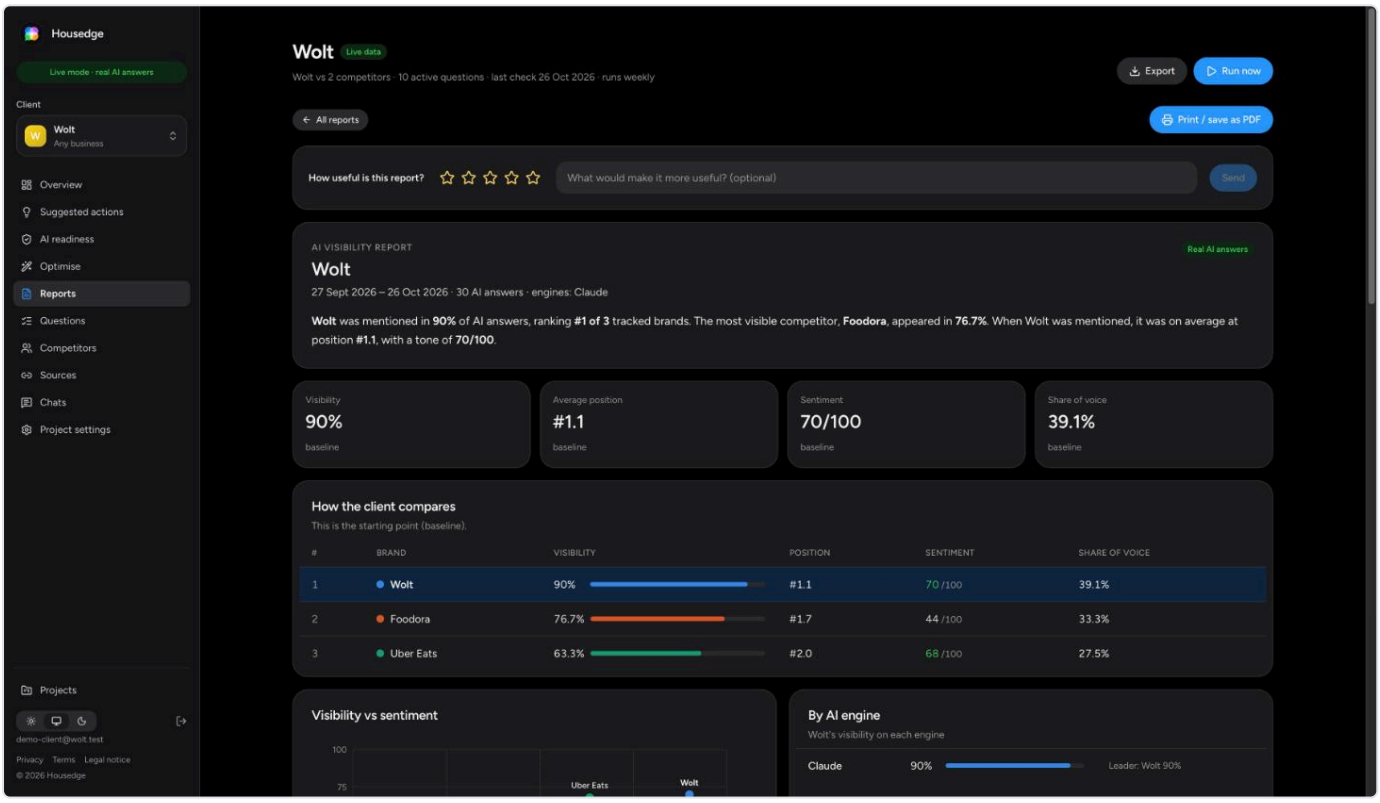

SOURCES

Which websites the AI relied on (Wikipedia, Yle, Helsinki Times…).

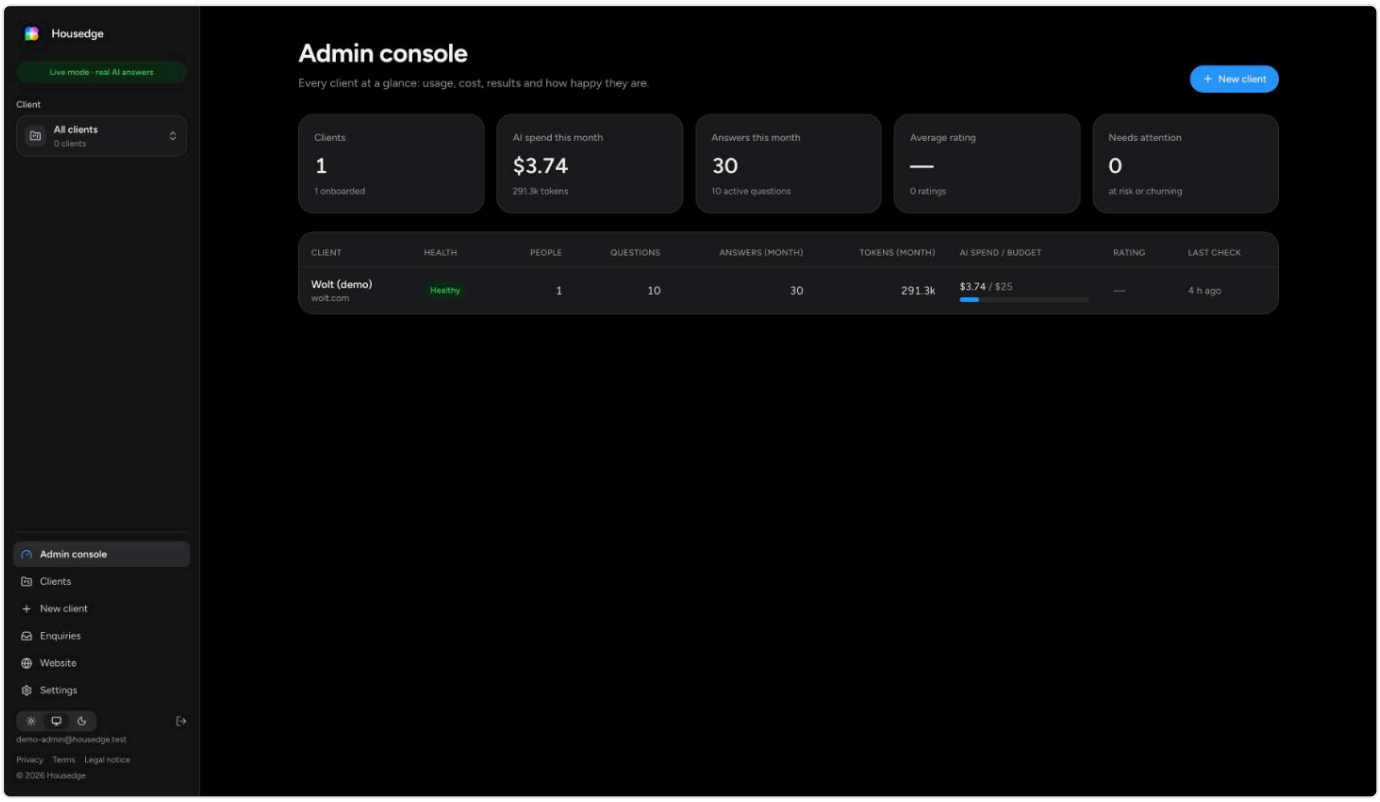

NEW: THE CLIENT RATES EACH REPORT

One line added above the report: 1–5 stars and an optional comment. The team sees it in the admin console. This is how we will know whether clients are happy, alongside the health status the team sets.

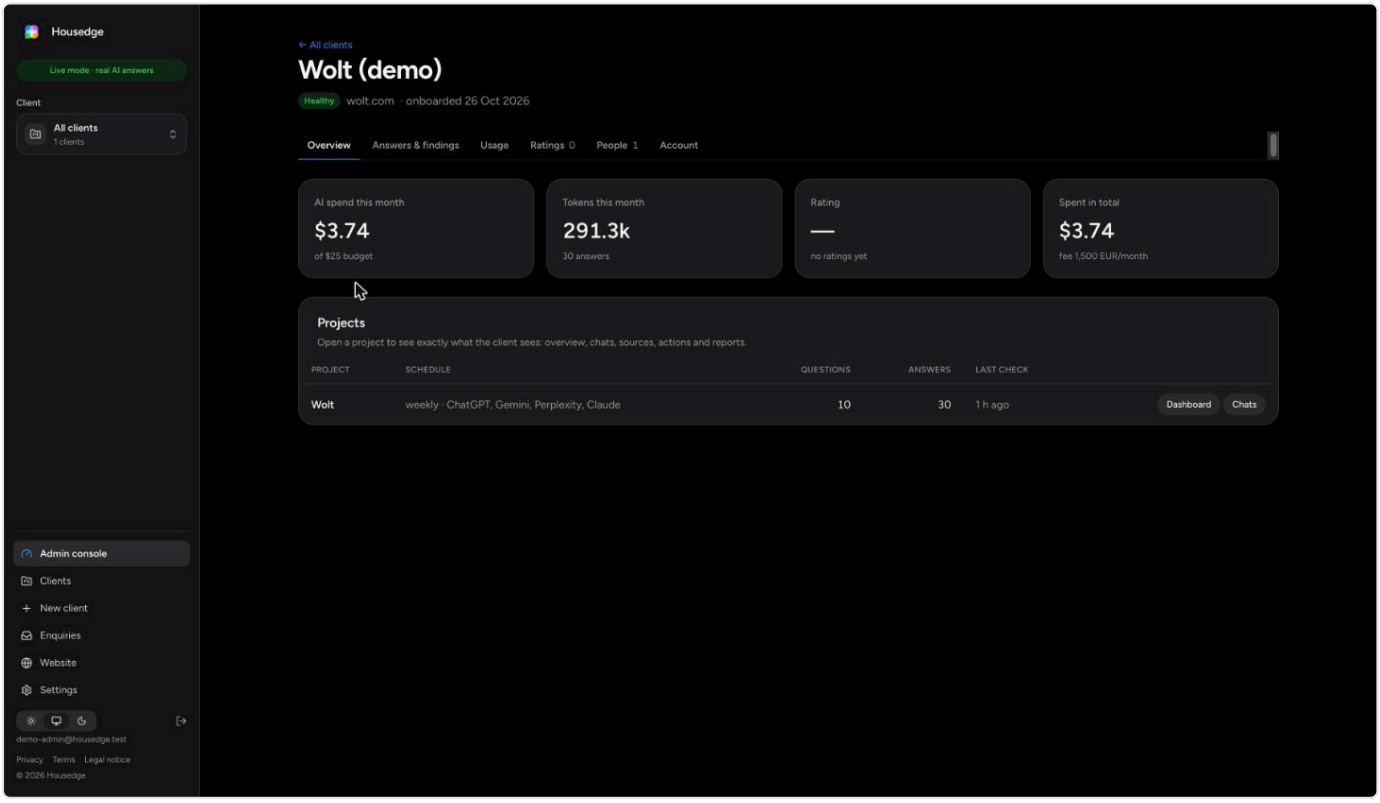

3. The admin console (team only)

ALL CLIENTS AT A GLANCE

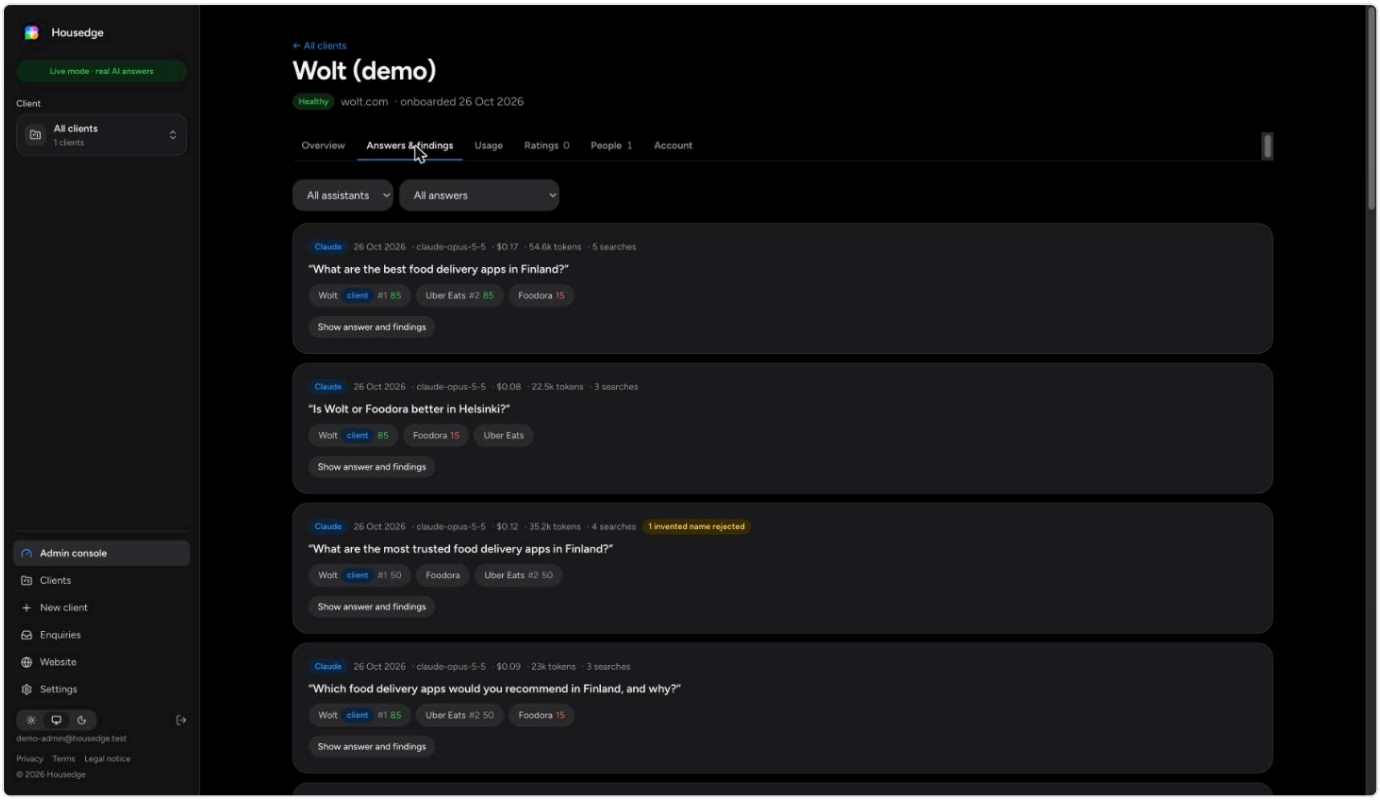

Health, people, questions, answers and AI tokens this month, AI spend against budget, average rating, last check. "Needs attention" counts clients marked at risk or churning.

ONE CLIENT: OVERVIEW

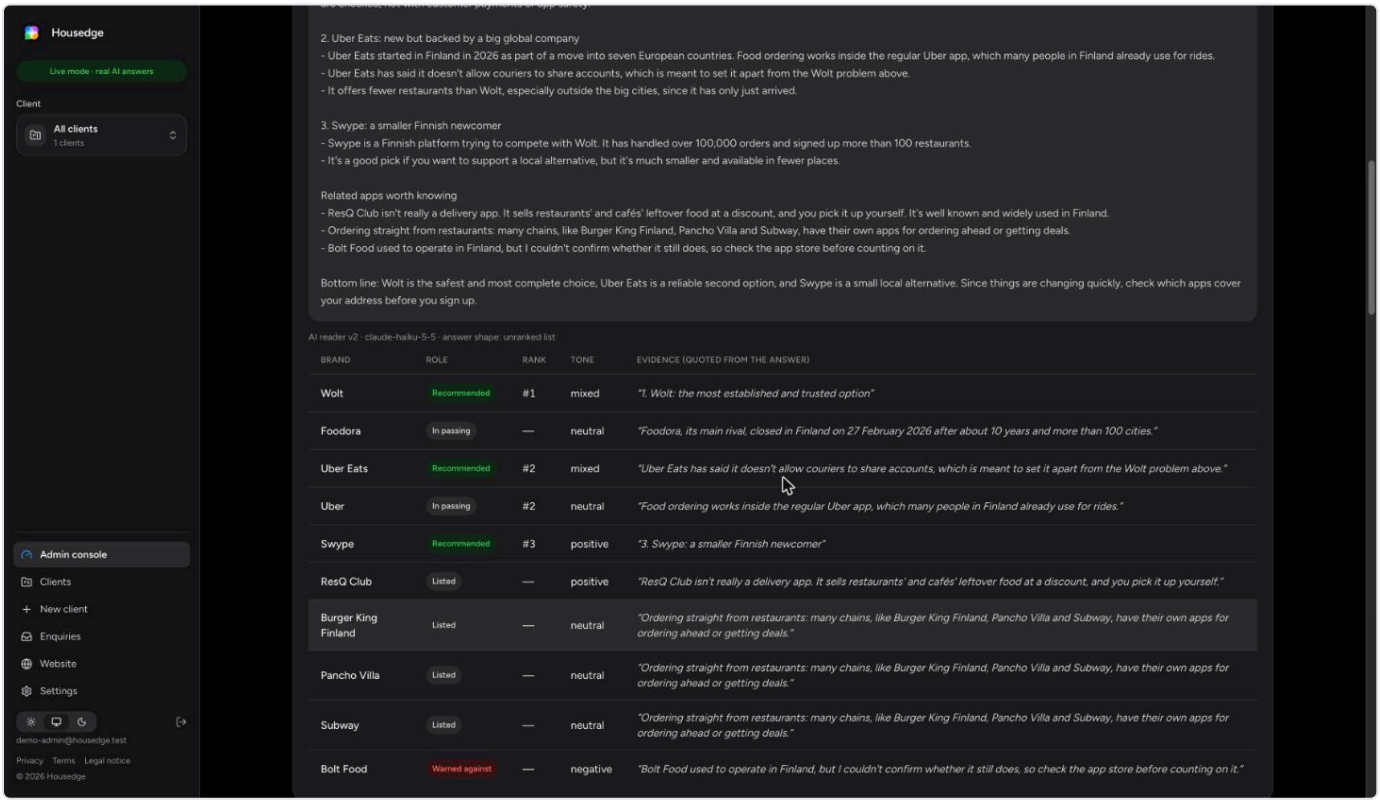

Spend this month against the $25 budget, tokens, rating, total spent, the fee they pay, and buttons to open exactly what the client sees.

ANSWERS & FINDINGS: CHECKING OUR OWN WORK

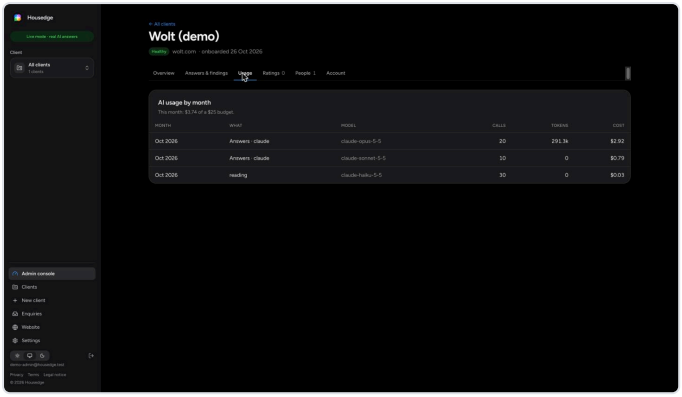

Every answer with its model, cost, tokens and number of web searches. A yellow tag shows when the AI reader proposed a brand that was not actually in the answer and we threw it out.

EVIDENCE BEHIND EACH FINDING

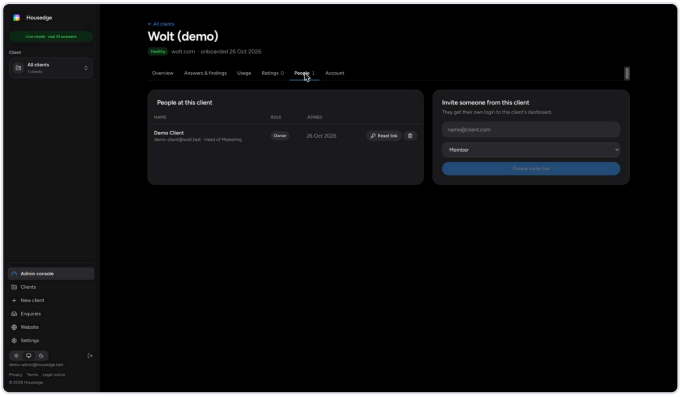

For every brand found: recommended, mentioned in passing, listed or warned against; its rank; its tone; and the exact sentence from the answer that proves it. If the quote is not in the answer, the finding is rejected.

USAGE BY MONTH

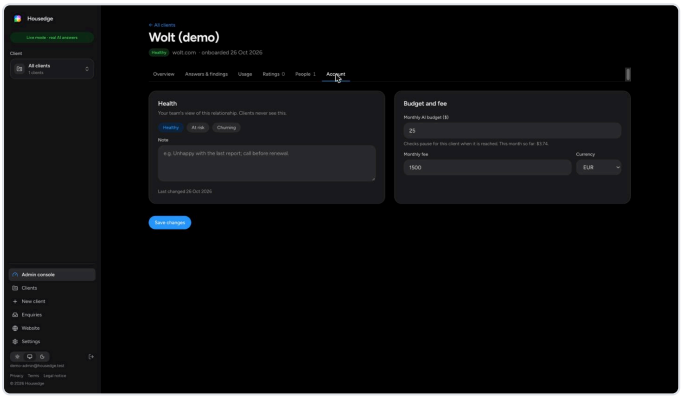

Per model. Token counts exist only for the batch answers; the older test runs did not record them.

PEOPLE

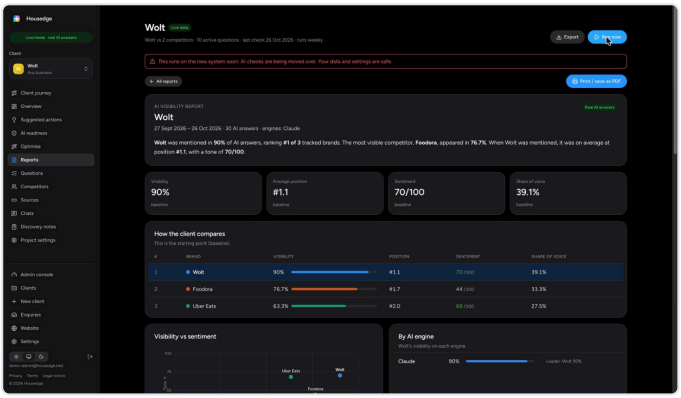

Who has access, a new invite link, a password reset link, or removing someone.

ACCOUNT: HEALTH, BUDGET, FEE

Health and its note are never shown to the client. When the monthly AI budget is reached, checks pause for that client.

WHAT IS NOT MOVED YET

"Run now" explains that AI checks are being moved over. Nothing breaks and no data is lost.

Cost per answer (from the accuracy tests)

HOW WE ASK	COST PER ANSWER	KNEW FOODORA HAD LEFT FINLAND	WAIT
Opus, live	$0.191	5 of 10	~10 seconds
Sonnet, live	$0.079	**0 of 10**	~3 seconds
Opus, batch (chosen for scheduled checks)	**$0.101**	**5 of 10**	up to a few hours (3 h 11 min in our test)
Haiku as the "reader" that finds brands, rank and tone	$0.0009	Matched Sonnet on tracked brands; every finding needs a quote from the answer.	

Scheduled weekly checks do not need to be instant, so the batch service gives Opus quality for about half the price. "Run now" can still use the live route when a client is waiting. For Wolt's setup (10 questions, 4 assistants, weekly) the app estimates about **$6.90 a month** against a $25 budget.

Speed

Pages load in about **1.2–1.8 seconds**. The client list for the team takes 2–4 seconds because it calculates numbers for every client. Fine for now, but it should be faster before we have many clients. Where the time goes in one request:

- ~0.2 s checking who is signed in by asking Supabase Auth. **Fix:** check the sign-in token locally; our project already uses the right kind of token for this.
- ~0.6 s in the database, mostly because each step travels between Frankfurt (where functions run) and Stockholm (where the database is), about 0.1 s per trip. Stockholm has no function region. **Fix:** fewer trips per request (combine queries), or later move the database to Frankfurt.
- ~0.4 s network from the laptop to Supabase.

What is next, in order

1. **Move the AI checks** (Run now, weekly schedule via batch, the Haiku reader, budget pause). Most important: without it, no new answers come in.
2. **Move existing clients from Railway** with an import tool (the Wolt import used for this report is the first version of it).
3. **Put the front end on Vercel** and point it at Supabase. Note: Vercel's free plan is for non-commercial use, so we need the Pro plan (about $20/month).
4. **Send invite and reset emails automatically** (connect an email service such as Resend or Postmark).
5. Website check, fact check and AI drafts.
6. Speed work described above.

Test environment: the app running locally against the real Supabase project (Stockholm, free plan) with demo accounts (demo-admin@housedge.test, demo-client@wolt.test) and the demo company "Wolt (demo)". These can be deleted before go-live; the real first admin is then created with the setup code. Nothing committed or pushed.
