Accuracy test: Wolt in Finland

The same 10 real AI answers, read by the old method and by the new one. Housedge, 26 October 2026.

In one paragraph. We ran a real check for Wolt (Finnish food delivery) against Foodora and Uber Eats, asking Claude 10 questions a customer in Finland would ask. We then read the same 10 answers twice: once with the original word-matching method, once with the new AI reading method. Whether a brand was mentioned came out the same (simple names were already found). What changed is the **meaning**: the new method saw that the AI tells people **Foodora has shut down in Finland**, which the old method scored as positive; it stopped inventing brands like “Payments” and “Cost.”; it stopped calling a brand “#1” just because it was named first; and it found the real alternatives people are pointed to (K-Ruoka, S-kaupat). The test also exposed a bug in the first version of the new method, which was fixed and re-tested the same day.

Answers tested
10
1 engine (Claude), Finland

Cost of asking the 10 questions
$1.91
Claude engine on Opus 5.5 + web search

Cost of the new reading
$0.009
Haiku 5.5, all 10 answers

Automated tests
69 / 69
passing after all changes

1. The headline numbers

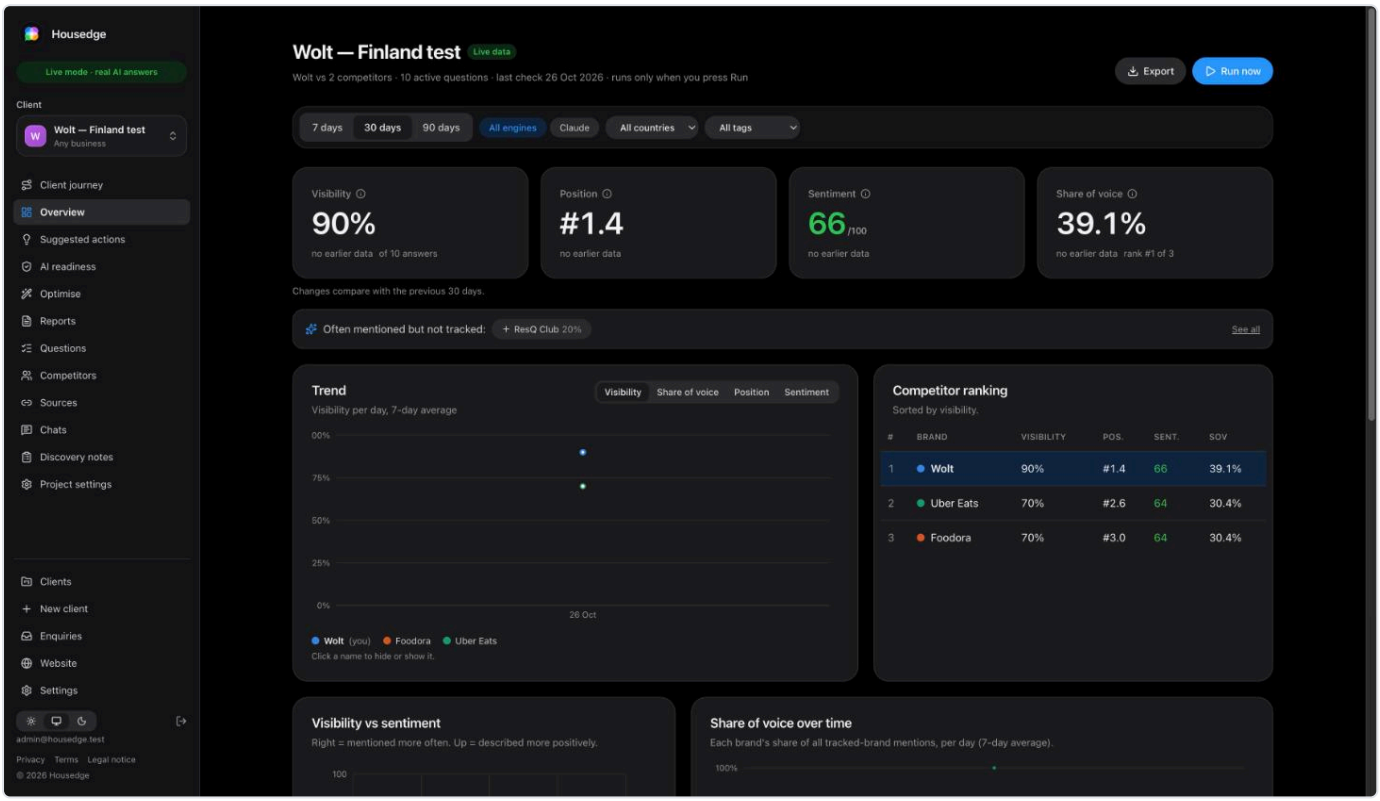

BRAND	VISIBILITY BEFORE	AFTER	POSITION BEFORE	AFTER	SENTIMENT BEFORE	AFTER	SHARE OF VOICE BEFORE	AFTER
Wolt (client)	90%	**90%**	#1.4	**#1.3**	66	**76**	39.1%	**39.1%**
Foodora	70%	**70%**	#3	**#1**	64	**35**	30.4%	**30.4%**
Uber Eats	70%	**70%**	#2.6	**#2**	64	**68**	30.4%	**30.4%**

- **Visibility did not change.** For plain names like Wolt, Foodora and Uber Eats the old word match already found them. The improvement is not in *whether* a brand is named.
- **Foodora's sentiment fell from 64 to 35.** This is the most important correction. Five of the ten answers say Foodora has left or is leaving Finland (it stopped operating on 27 February 2026); one older-looking answer still calls it “strong in Finland”. The old method found no warning words on its list and scored Foodora positive. The new method reads it as a warning. For a client, “AI tells your customers your competitor has closed” is a key finding, and the old tool hid it.
- **Position now means a real rank.** The old method ranked brands by which was named first in the text. The new one only gives a rank when the answer is a numbered list (“1. Wolt, 2. Uber Eats”). That is why Foodora is now “#1.0”: in the one list that ranked it (“most affordable apps”), it was number 1.
- **Wolt's sentiment rose from 66 to 76** because the new method understands sentences like “If you only install one app, make it Wolt”, which contain no word on the old positive-word list.

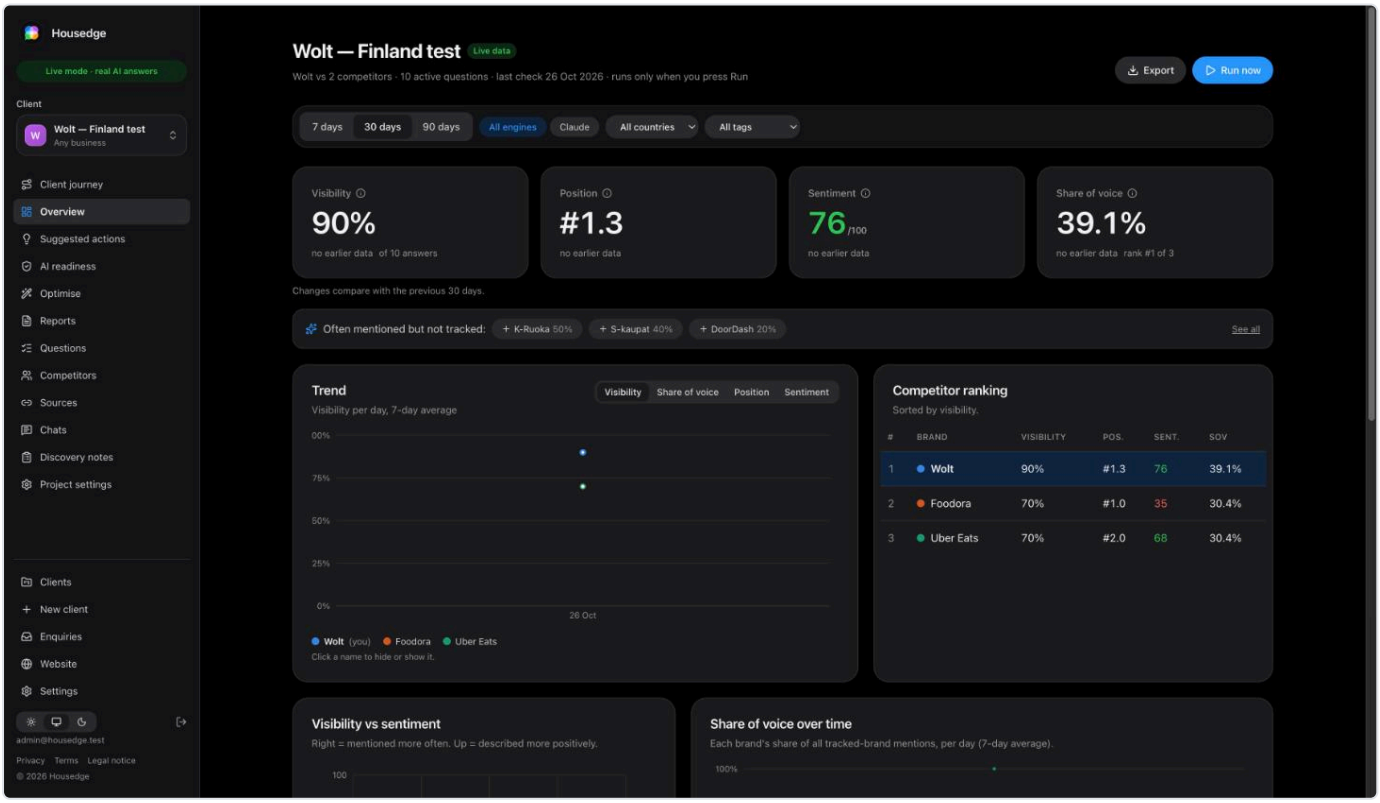

2. Screens: before and after

Overview

BEFORE

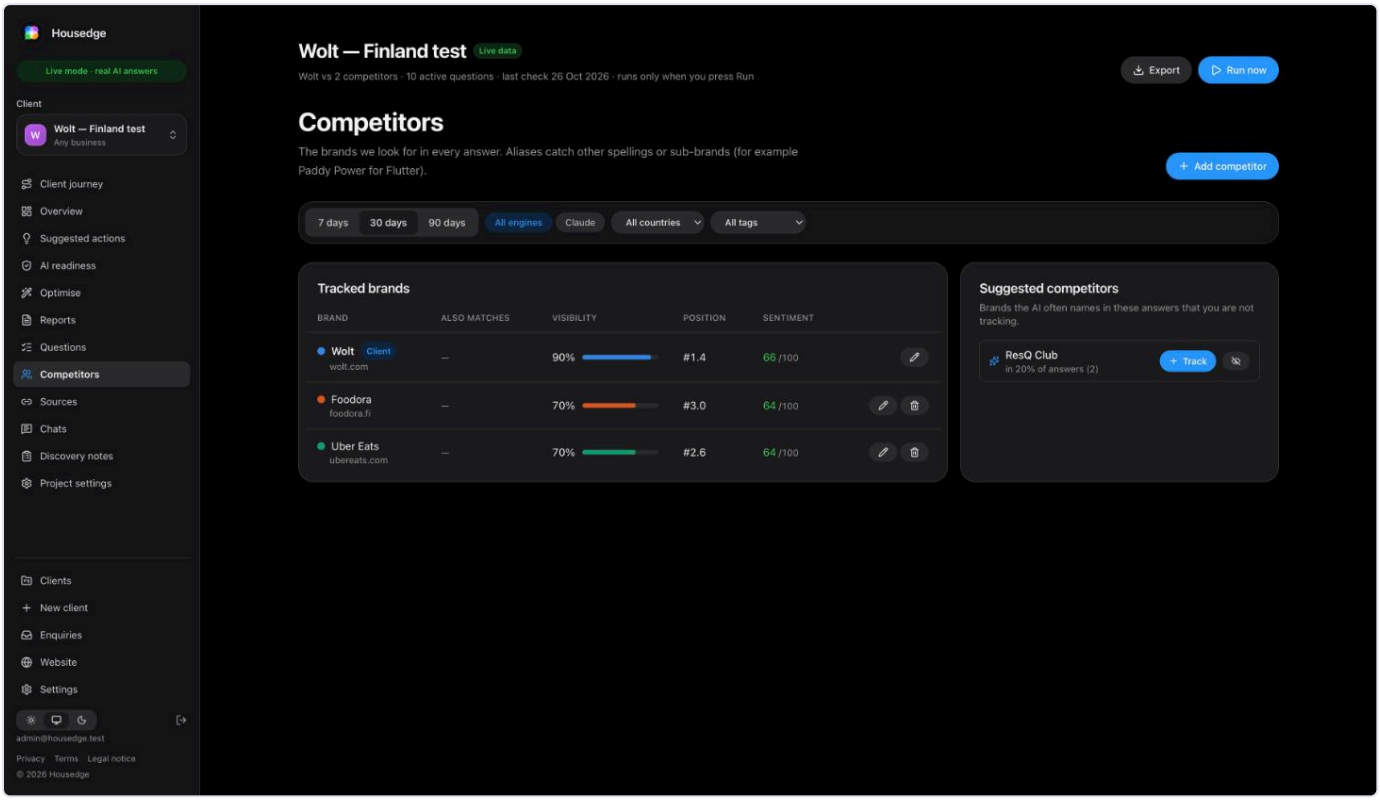

AFTER

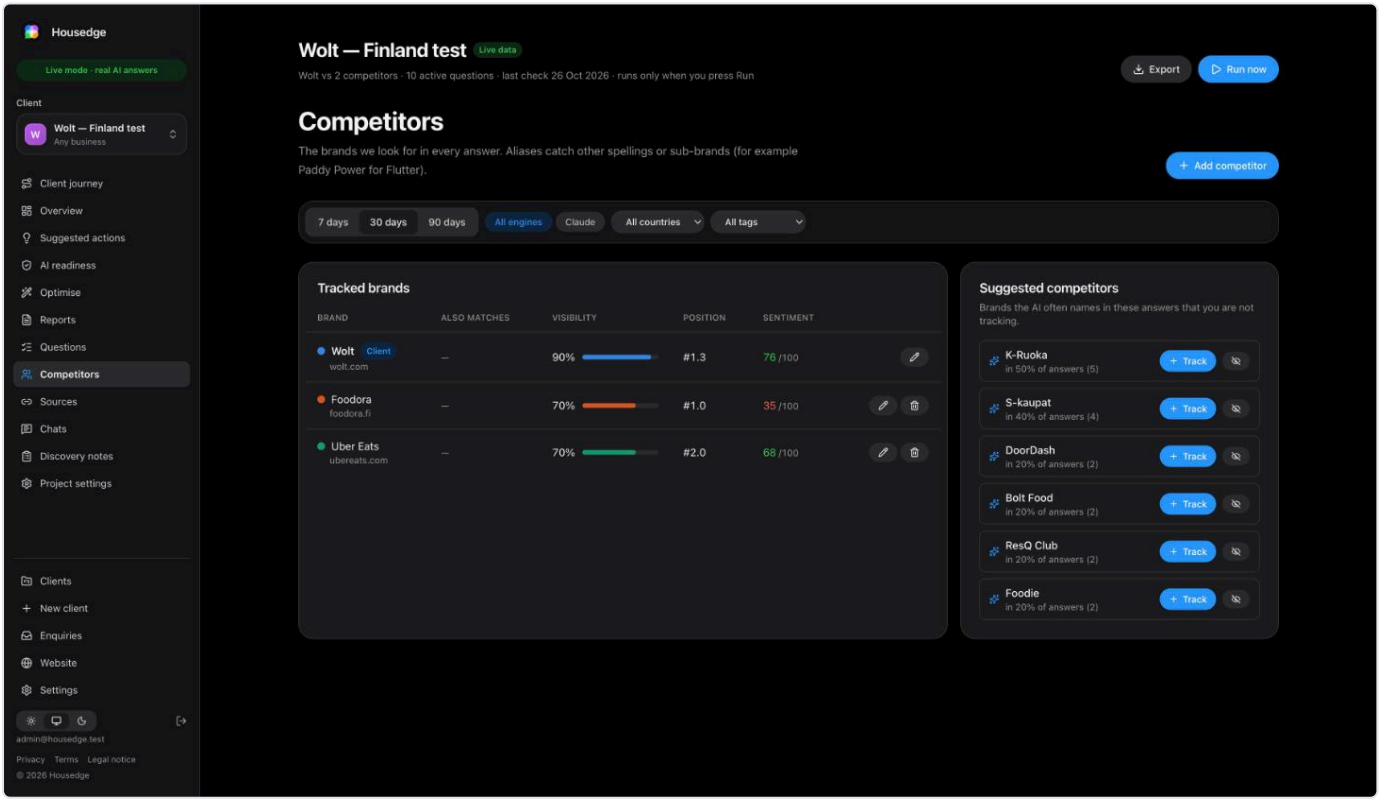

Same answers, same day. The strip under the numbers (“Often mentioned but not tracked”) went from ResQ Club only to K-Ruoka, S-kaupat and DoorDash.

Competitors

BEFORE

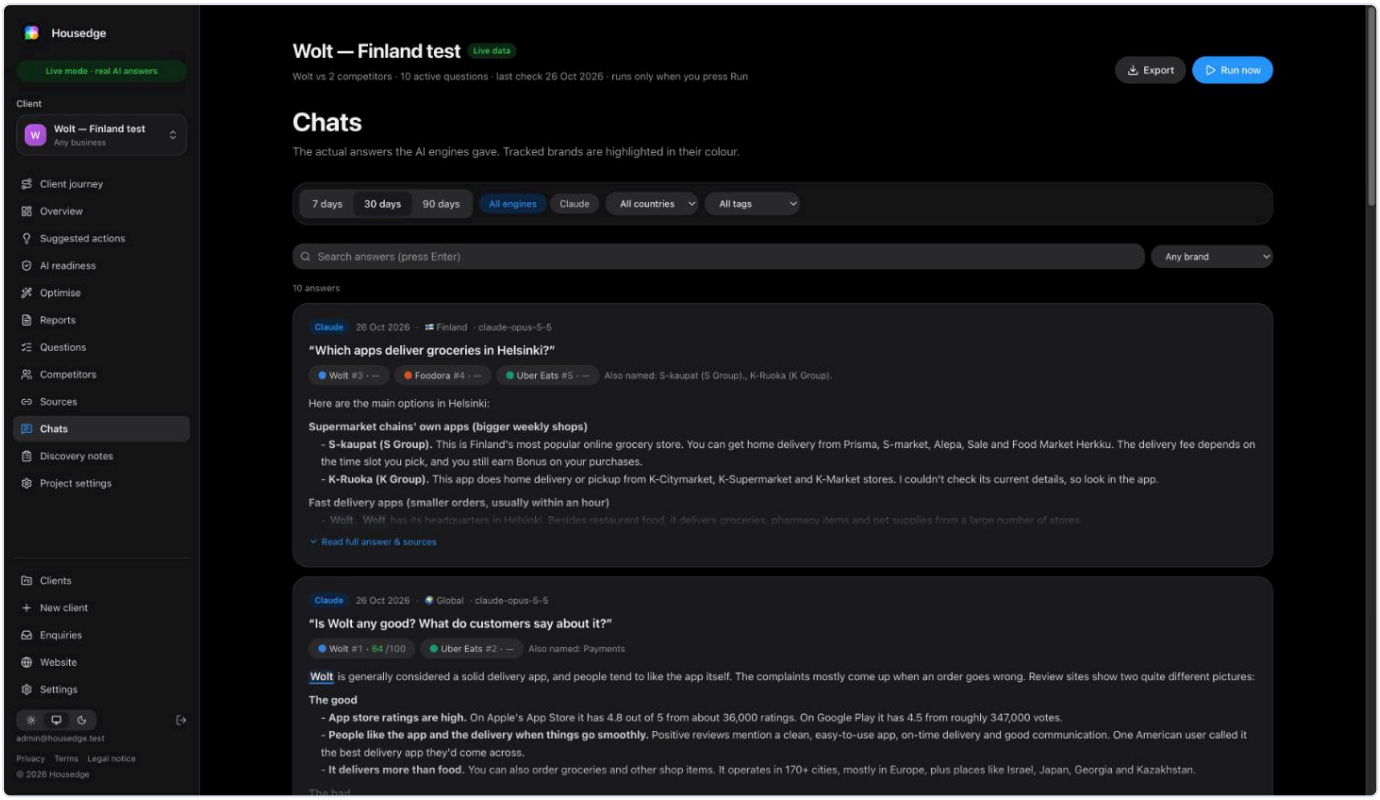

AFTER

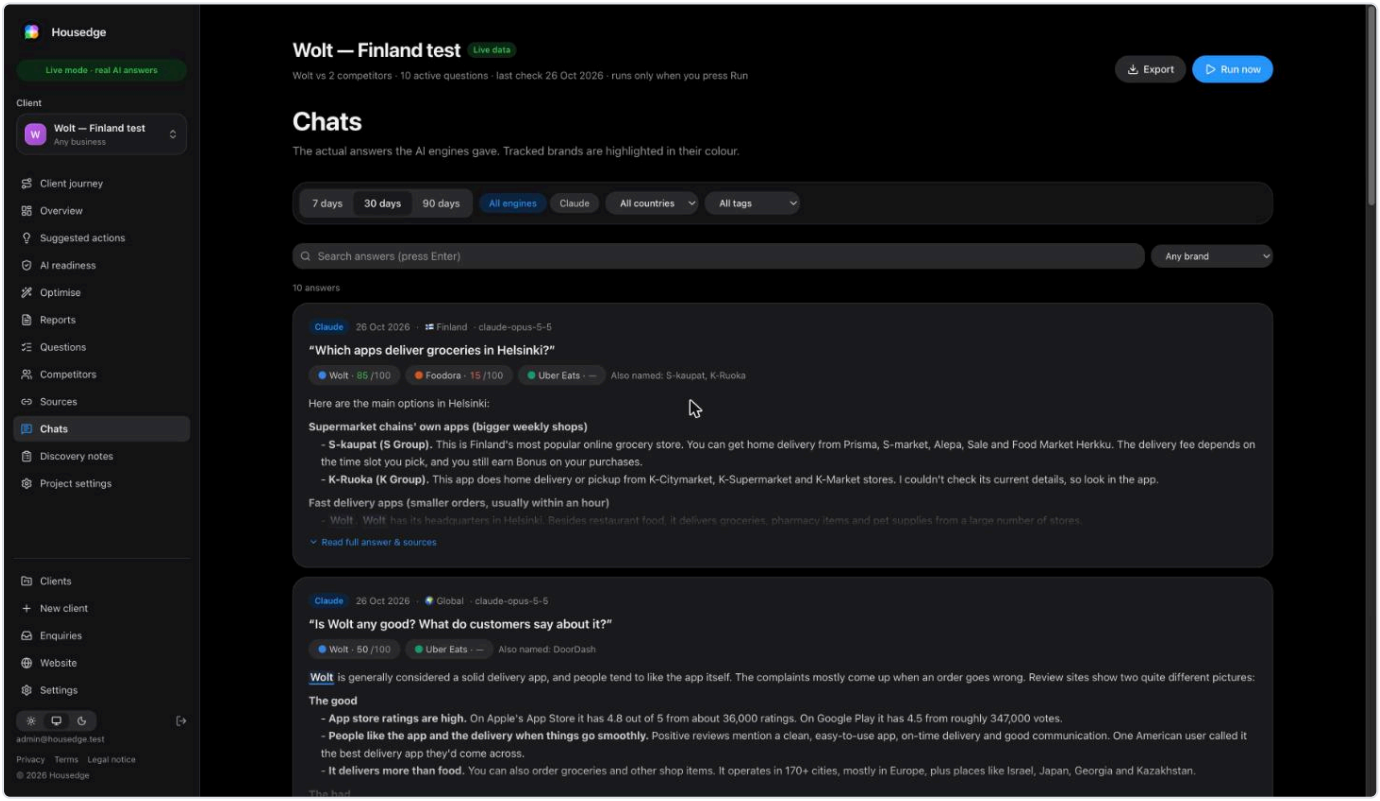

Before: Foodora rated 64 (positive) at #3.0, one suggestion. After: Foodora rated 35 (negative); six suggestions, all real companies, spellings merged (“S-kaupat” and “S-kaupat.fi” count as one).

Chats (the real answers)

BEFORE

AFTER

Before: "Also named: S-kaupat (S Group)., K-Ruoka (K Group)." with the full stops inside the names, and Wolt "#3" because two supermarkets were named first. After: clean names, Wolt with no rank (the answer is not a ranked list) and a tone score; Foodora marked negative (15) because the answer says it is shutting down.

3. Answer by answer

Left: what the old method recorded (rank by first mention, tone from a word list; "—" = no tone words found). Right: what the new method recorded, with the exact sentence from the answer it is based on. Only the three tracked brands are shown in detail.

QUESTION ASKED	OLD READING	NEW READING
What are the most trusted food delivery apps in Finland?	**Wolt** #1 · tone 64 **Foodora** #3 · tone — **Uber Eats** #2 · tone 64 also named: ResQ Club	**Wolt** #1 · recommended, positive *"If you only install one app, make it Wolt."* **Uber Eats** #2 · listed, mixed *"Uber Eats started operating in Finland in late April 2026, becoming Wolt's new competitor after Foodora left."* **Foodora** mentioned in passing, negative *"Foodora used to be the second big platform, so older guides still recommend it."* also named: ResQ Club, Foodie.fi, K-Ruoka, S-kaupat, McDonald's, Burger King

Is Wolt or Foodora better in Helsinki?	**Wolt** #2 · tone 64 **Foodora** #1 · tone — **Uber Eats** #3 · tone —	**Foodora** mentioned in passing, negative *“Foodora has left. It shut down its Finnish operations on 27 February 2026 after about 10 years and roughly 80 …”* **Wolt** recommended, positive *“Wolt is the main option. Wolt was founded in Helsinki and took most of the Finnish market, which is a big reas…”* **Uber Eats** listed, neutral *“Uber Eats is a new competitor. After Foodora left, Wolt was the only service for a few months.”*
Is Wolt any good? What do customers say about it?	**Wolt** #1 · tone 64 **Uber Eats** #2 · tone — also named: Payments	**Wolt** listed, mixed *“Wolt is generally considered a solid delivery app, and people tend to like the app itself.”* **Uber Eats** compared, neutral *“That's in the same range as Uber Eats (2.4) and DoorDash (2.8), so low written-review scores seem to be common…”* also named: DoorDash
Which apps deliver groceries in Helsinki?	**Wolt** #3 · tone — **Foodora** #4 · tone — **Uber Eats** #5 · tone — also named: S-kaupat (S Group)., K-Ruoka (K Group).	**Wolt** recommended, positive *“For a few items quickly, Wolt is the main choice.”* **Foodora** warned against, negative *“- Foodora. Foodora is shutting down in Finland. It has said it will stop operating on 27 February 2026, and or…”* **Uber Eats** listed, neutral *“- Uber Eats. News reports say it plans to enter Finland, which would make it the main competitor to Wolt once …”* also named: S-kaupat, K-Ruoka

4. What improved, with proof

PROBLEM IN THE OLD METHOD	SEEN IN THIS TEST	NEW METHOD
Invents brands from headings and full stops	Suggested competitors included **“Cost.”, “Deals.”, “Groceries”, “Payments”, “Subscription.”**	None. A name is kept only if the answer really names a company.
Built-in gambling brand list leaks into every industry	**“Gaming Innovation Group”** (a casino software company) suggested as a Wolt competitor from the “pros and cons of Wolt” answer	No industry list at all. Same method for any business.
Cannot read meaning (shut down, avoid, not cheap)	Foodora scored **64, positive** although answers say it closed in Finland	Foodora marked **“warned against, negative”** with the quote: “Foodora shut down in Finland on 27 February 2026, affecting 80 employees.”
“Named first” treated as “ranked first”	“Is Wolt or Foodora better in Helsinki?” gave **Foodora #1, Wolt #2** because the answer opens with “Foodora has left.”	No rank (not a list). Wolt “recommended”, Foodora “negative”.
The subject of the question counted as recommended	“Best alternatives to Wolt” gave **Wolt #1, tone 78**	Wolt “mentioned in passing”; the alternatives are what is recorded.
Misses real alternatives	K-Ruoka and S-kaupat (the supermarkets' own delivery apps) appeared once each, with broken names	**K-Ruoka in 5 answers, S-kaupat in 4**, the top two suggestions
No evidence	A number with nothing behind it	Every reading carries a sentence copied from the answer, checked word for word by the code

5. Problems the test found, and what was done

PROBLEM	CAUSE	STATUS
First version lost real brands. Foodora and Uber Eats dropped from 70% to 60% visibility.	The AI reader found them, but backed them with a sentence saying “it” instead of the name. The safety check then threw the whole brand away instead of just the weak quote.	**Fixed and re-tested: a brand is kept whenever its name is in the answer; a weak quote is replaced by the real sentence naming it, and counted (2 quotes in this test).**
Rank was unstable. Reading the same answer 3 times gave “narrative”, “unordered list”, “ranked list”.	The AI guessed the list type differently each time.	**Fixed: rank is now read from the numbered lines in the text by code, so it is identical on every run.**

PROBLEM	CAUSE	STATUS
Invented names. 4 names were rejected in the stored run because they are not in the answer.	The AI reader occasionally lists a name that is not there. The check caught all of them; a second full pass produced none.	**Working as designed. Rejected names are now saved, so each one can be audited.**
Duplicates in suggestions (“Foodie” and “Foodie.fi”; “Wolt Market”, “Foodora Pro” suggested as competitors).	Suggestions were grouped by exact spelling.	**Fixed: spellings of one company are merged; product lines of a tracked brand are not suggested.**
A bare “#” on the Chats page when there is no rank.	The page assumed every brand has a position.	**Fixed.**

6. What is still not proven

- **This test checks the reading method, not Wolt's real standing.** Ten answers from one engine on one day is a sample, not a measurement. Wolt's true visibility needs repeated runs on all four engines.
- **Role and tone are the AI reader's judgement.** They looked right in this test, but the reader labelled one brand “listed”, “compared” and “recommended” across three readings of the same answer. The accuracy of these labels must be measured against about 150 answers labelled by two people (see docs/ACCURACY.md) before quoting an accuracy figure to a client.
- **Same company, different names:** “Foodie” is S-Group's former name for S-kaupat. Spelling rules cannot know that; it needs an alias added on the Competitors page.
- **DoorDash** is suggested; it owns Wolt and is also a real alternative in one answer. A human should decide.
- The new reading is switched on through the API; there is no button in Settings yet.

7. Cost: where the money went

WHAT	MODEL	CALLS	COST
Asking the 10 questions (the AI answering like it would for a real customer, with web searches)	Claude Opus 5.5 (app default for the Claude engine)	10	**$1.91** (about $0.19 per answer)
New reading of the answers (two passes: first version and fixed version)	Claude Haiku 5.5	20	**$0.017**
Diagnosing the first-version bug (extra re-reads)	Claude Haiku 5.5	14	under $0.02

About 98% of the cost was asking the questions, not reading the answers. The reading step on Haiku costs about one tenth of a cent per answer. The app's own estimate for a Claude answer is $0.10; the real cost was about double, mainly because web search results add a lot of text to every request. The estimate in Settings should be corrected.

What a client would cost (Claude engine only, 10 questions, per month)

OPTION	PER ANSWER	DAILY CHECKS (300 ANSWERS)	WEEKLY CHECKS (43 ANSWERS)	TRADE-OFF
Opus 5.5 (today)	$0.19 (measured)	about $57	about $8	Closest to what Claude users see
Sonnet 5.5	about $0.11 (estimate)	about $33	about $5	Half the token price; worth a test on the same 10 questions (about $1)
Haiku 5.5	about $0.04–0.05 (estimate)	about $14	about $2	Needs a code change (older web-search tool) and answers differ more from what Claude users see

Estimates assume the same amount of text per request as measured on Opus; web-search fees ($0.01 per search) stay the same on every model. Cheaper levers that do not change the model: weekly instead of daily checks for most clients, and fewer searches per answer (up to 5 today).

8. Recommended next steps

1. Test Sonnet 5.5 as the Claude engine on these same 10 questions and compare answers (about $1).
2. Correct the cost estimate in Settings ($0.10 → measured $0.19 for Opus).
3. Build the 150-answer answer key and score both methods with the harness in server/eval/.
4. Add the on/off switch for the new reading to Settings, then switch it on for real clients.
5. Default new clients to weekly checks; daily only when the client pays for it.

9. What was changed in the code

FILE	CHANGE
server/extract.js (new)	The new reading: AI extraction, word-for-word evidence check, deterministic rank, brand matching, audit counts

FILE	CHANGE
server/stats.js (new)	Error margins and “is this change real?” for the reports (not yet shown on screen)
server/eval/ (new)	Tools to score any reading method against hand-labelled answers
server/analysis.js, metrics.js	Shared name matching; suggestions merge spellings and skip a tracked brand's own products
server/runner.js, db.js, index.js, claude.js	Reading runs after each check when switched on; stored readings re-used for free when competitors change; Haiku priced correctly in the spending cap
web/src/pages/Chats.jsx	No bare “#” when a brand has no rank
server/tests/extract.test.js (new)	9 tests, including this exact Uber Eats / Foodora case

Nothing has been committed or pushed. Test environment: local copy of the app, port 3311, throwaway database; original version run from the last commit (4704727).
